

AMENDMENTS TO THE SPECIFICATION

Please add the following abstract beginning as page 17 of this application.

Abstract

A system comprising first and second fire-resistant parts for at least temporary fire-resistant sealing of an opening in a wall in which at least one transport device, such as a cable, conduit or tube, has been fed through or will be fed through. The first and second parts are each at least partly placeable in the opening. The first parts are designed to at least partly envelop the transport device and the second parts are designed to be placed between the first parts and/or between the first parts and an inner wall of the opening for the purpose of at least virtually completely sealing the opening. The first parts are substantially manufactured from a fire-resistant rubber. The second parts are manufactured from a fire-resistant material based on an elastomeric foam with a substantially closed cell structure. The foam includes at least one crust-forming, fire-retardant material.
